Sub Query

Best
Practice

Previous lecture

- INNER JOIN
- OUTER JOIN
- EXCLUDING JOIN
- SELF JOIN
- CROSS JOIN
- UNION & UNION ALL

What we will explore today?

- Sub queries
- Advance operators
- Rules of sub query
- Practice

Sub query

- A sub-query, also called an inner query, is a SQL query nested inside a larger query.
- basically it's query inside query

How it's work

- Inner query is independent of outer query.
- Inner query is executed first and the results are stored.
- Outer query then runs on the stored results.
- Exception **Correlated subqueries**

Example 1

| | ID | FirstName | MiddleName | LastName | Math | Physic | Chemical | DateOfBirth |
|---|----|-----------|------------|----------|------|--------|----------|-------------|
| 1 | 1 | Nguyễn | Văn | Huân | 7 | 8 | 9 | 2000-10-15 |
| 2 | 2 | Võ | Văn | Hiếu | 3 | 4 | 5 | 2005-10-15 |
| 3 | 3 | Nguyễn | Thị | Huệ | 2 | 5 | 7 | 2008-10-15 |
| 4 | 4 | Nguyễn | NULL | Truong | NULL | 5 | 7 | 1999-10-15 |

USE LECTURE4 FUNCTION

SELECT LastName, Physic,
FROM Student

2

| LastName | Physic |
|----------|--------|
| Huân | 8 |
| Hiếu | 4 |
| Huệ | 5 |
| Truong | 5 |

3

| | LastName | Physic | AVG OF Physic |
|---|----------|--------|---------------|
| 1 | Huân | 8 | 5.500000 |
| 2 | Hiếu | 4 | 5.500000 |
| 3 | Huệ | 5 | 5.500000 |
| 4 | Truong | 5 | 5.500000 |

(SELECT AVG(Physic * 1.0) FROM Student) AS 'AVG OF Physic'

1

AVG OF Physic = 5.500000

3

Example 2

```
USE LECTURE5_JOIN_DEMO
```

```
SELECT CustomerID, FullName
```

```
FROM Customer
```

```
WHERE CustomerID IN (SELECT CustomerID FROM CustomerOrder)
```

2

| | CustomerID | FullName |
|---|------------|-----------------|
| 1 | 1 | Châu Tinh Trì |
| 2 | 2 | Châu Nhuận Phát |
| 3 | 3 | Lý Tiểu Long |
| 4 | 4 | Thành Long |

3

| | CustomerID | FullName |
|---|------------|---------------|
| 1 | 1 | Châu Tinh Trì |
| 2 | 3 | Lý Tiểu Long |

1

| | OrderID | CustomerID | FoodName |
|---|---------|------------|-----------|
| 1 | 1 | 1 | Hèo Quay |
| 2 | 2 | 1 | Gà Luộc |
| 3 | 3 | 3 | Bò Lá Lốt |
| 4 | 4 | 100 | Dê Nướng |

Type of Sub Query

- Single row sub query
- Multiple row sub query
- Multiple column sub query
- Corrolated sub query
- Nested sub query

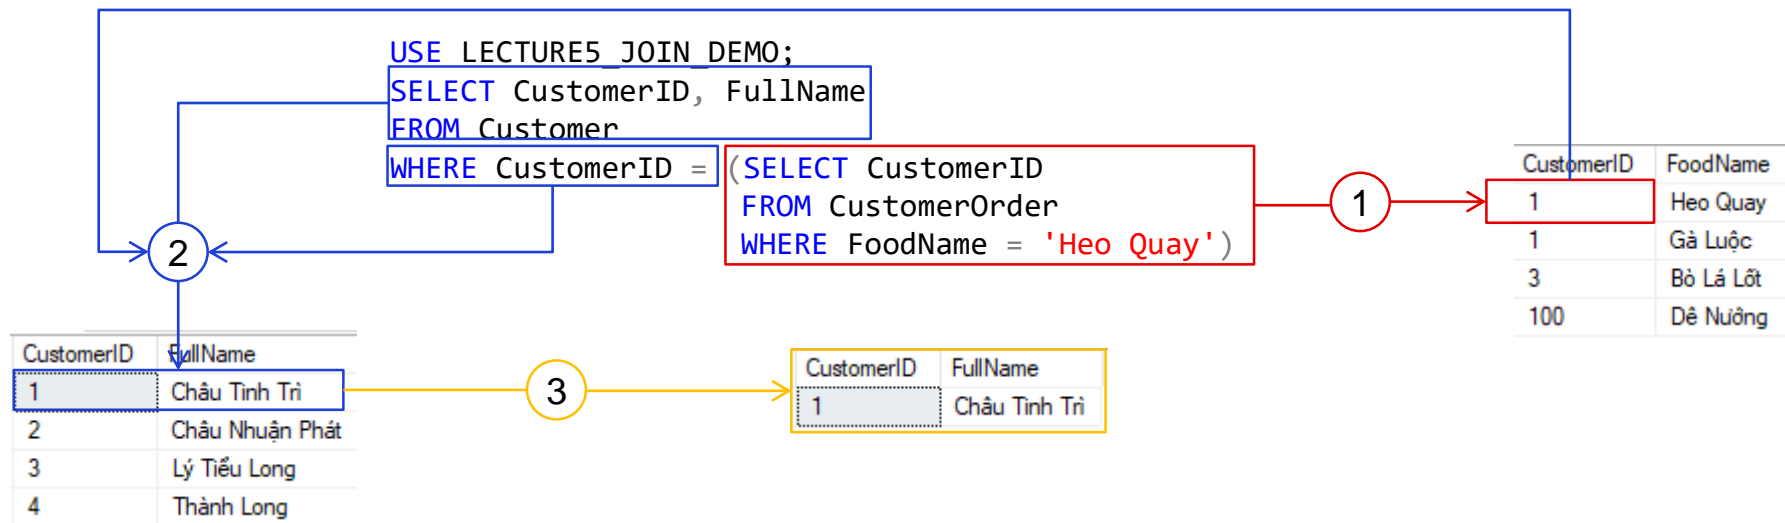

Single row query

- A single row subquery returns zero or one row to the outer SQL statement.
- You can place a subquery in a WHERE, HAVING or FROM clause of a SELECT statement.

Single row query

Exercise

Customer

| CustomerID | FullName |
|------------|-----------------|
| 1 | Châu Tinh Trì |
| 2 | Châu Nhuận Phát |
| 3 | Lý Tiểu Long |
| 4 | Thành Long |

CustomerOrder

| OrderID | CustomerID | FoodName | DeliveryAddressID |
|---------|------------|-----------|-------------------|
| 1 | 1 | Heo Quay | 1 |
| 2 | 1 | Gà Luộc | 1 |
| 3 | 3 | Bò Lá Lốt | 2 |
| 4 | 100 | Dê Nướng | 2 |

DeliveryAddress

| ID | FullAddress |
|----|-------------|
| 1 | TP. HCM |
| 2 | TP. HA NOI |

Query CustomerID, OrderID, FoodName from CustomerOrder with Delivery FullAddress = "TP. HCM" using single row subquery

Multiple row subquery

- Multiple row subquery returns one or more rows to the outer SQL statement. You may use the IN, ANY, or ALL operator in outer query to handle a subquery that returns multiple rows.

Multiple row subquery

```
USE LECTURE5_JOIN_DEMO
```

```
SELECT CustomerID, FullName  
FROM Customer
```

```
WHERE CustomerID IN (SELECT CustomerID FROM CustomerOrder)
```

2

| | CustomerID | FullName |
|---|------------|-----------------|
| 1 | 1 | Châu Tinh Trì |
| 2 | 2 | Châu Nhuận Phát |
| 3 | 3 | Lý Tiểu Long |
| 4 | 4 | Thành Long |

1

| | OrderID | CustomerID | FoodName |
|---|---------|------------|-----------|
| 1 | 1 | 1 | Hèo Quay |
| 2 | 2 | 1 | Gà Luộc |
| 3 | 3 | 3 | Bò Lá Lốt |
| 4 | 4 | 100 | Dê Nướng |

3

| | CustomerID | FullName |
|---|------------|---------------|
| 1 | 1 | Châu Tinh Trì |
| 2 | 3 | Lý Tiểu Long |

Exercise

Customer

| CustomerID | FullName |
|------------|-----------------|
| 1 | Châu Tinh Trì |
| 2 | Châu Nhuận Phát |
| 3 | Lý Tiểu Long |
| 4 | Thành Long |

CustomerOrder

| OrderID | CustomerID | FoodName | DeliveryAddressID |
|---------|------------|-----------|-------------------|
| 1 | 1 | Heo Quay | 1 |
| 2 | 1 | Gà Luộc | 1 |
| 3 | 3 | Bò Lá Lốt | 2 |
| 4 | 100 | Dê Nướng | 2 |

DeliveryAddress

| ID | FullAddress |
|----|-------------|
| 1 | TP. HCM |
| 2 | TP. HA NOI |

Query CustomerID, OrderID, FoodName from CustomerOrder with Delivery FullAddress = "TP. HCM" or "TP. HA NOI" using multiple row subquery

MULTIPLE COLUMN

- Multiple columns subquery returns more columns to outer SQL statement. You may use the EXISTS operator in outer query to handle a subquery that returns multiple columns.

CORROLATED SUBQUERY

- Normal subquery executes the subquery first and provides the value to the outer query, whereas **correlated subquery** references a column in the outer query and **executes the subquery once for each row in the outer query..**

How it work

```
USE LECTURE5_JOIN_DEMO;
```

```
SELECT CustomerID, FullName
```

```
FROM Customer
```

```
WHERE EXISTS
```

```
(SELECT CustomerID, OrderID, FoodName  
FROM CustomerOrder  
WHERE CustomerOrder.CustomerID = Customer.CustomerID)
```

1

2

3

4

6

5

| CustomerID | FullName |
|------------|-----------------|
| 1 | Châu Tinh Trí |
| 2 | Châu Nhuận Phát |
| 3 | Lý Tiểu Long |
| 4 | Thành Long |

| CustomerID | OrderID | FoodName |
|------------|---------|-----------|
| 1 | 1 | Hèo Quay |
| 1 | 2 | Gà Luộc |
| 3 | 3 | Bò Lá Lốt |
| 100 | 4 | Dê Nướng |

| CustomerID | FullName |
|------------|---------------|
| 1 | Châu Tinh Trí |
| 3 | Lý Tiểu Long |

Exercise

```
USE MASTER;  
DROP DATABASE IF EXISTS LECTURE5_SELFT_JOIN;  
CREATE DATABASE LECTURE5_SELFT_JOIN;  
USE LECTURE5_SELFT_JOIN;
```

```
CREATE TABLE Employee(  
    ID int PRIMARY KEY IDENTITY(1, 1),  
    FullName nvarchar(20) NOT NULL,  
    ManagerID int,  
);
```

```
INSERT INTO Employee (FullName, ManagerID)  
VALUES(N'HÀO CEO', NULL), (N'HƯỜNG DIRECTOR', 1), (N'MÃN CTO', 1), (N'HUY CULI', 3)
```

Exercise 1

| Results | | Messages | |
|---------|----|----------------|-----------|
| | ID | FullName | ManagerID |
| 1 | 1 | HÀO CEO | NULL |
| 2 | 2 | HƯỜNG DIRECTOR | 1 |
| 3 | 3 | MÃN CTO | 1 |
| 4 | 4 | HUY CUI | 3 |

Query the manager who has at least 1 employee

Exercise 2

| Results | | Messages | |
|---------|----|----------------|-----------|
| | ID | FullName | ManagerID |
| 1 | 1 | HÀO CEO | NULL |
| 2 | 2 | HƯỜNG DIRECTOR | 1 |
| 3 | 3 | MÃN CTO | 1 |
| 4 | 4 | HUY CULI | 3 |

| Results | | Messages | |
|---------|----|----------------|-----------|
| | ID | FullName | ManagerID |
| 1 | 1 | HÀO CEO | NULL |
| 2 | 2 | HƯỜNG DIRECTOR | 1 |
| 3 | 3 | MÃN CTO | 1 |
| 4 | 4 | HUY CULI | 3 |

Query the manager information (ID, FullName) who has at least 2 employee

NESTED SUB QUERY

```
USE LECTURE5_JOIN_DEMO;
```

```
SELECT CustomerID, FullName  
FROM Customer  
WHERE CustomerID IN (
```

```
SELECT CustomerID  
FROM CustomerOrder  
WHERE DeliveryAddressID =
```

```
(SELECT ID  
FROM DeliveryAddress  
WHERE FullAddress = 'TP. HA NOI')
```

3

| | CustomerID | FullName |
|---|------------|-----------------|
| 1 | 1 | Châu Tinh Trí |
| 2 | 2 | Châu Nhuận Phát |
| 3 | 3 | Lý Tiểu Long |
| 4 | 4 | Thành Long |

2

| | OrderID | CustomerID | FoodName | DeliveryAddressID |
|---|---------|------------|-----------|-------------------|
| 1 | 1 | 1 | Hèo Quay | 1 |
| 2 | 2 | 1 | Gà Lược | 1 |
| 3 | 3 | 3 | Bò Lá Lốt | 2 |
| 4 | 4 | 100 | Dê Nướng | 2 |

1

| | ID | FullAddress |
|---|----|-------------|
| 1 | 1 | TP. HCM |
| 2 | 2 | TP. HA NOI |

SOME RULE OF SUB QUERY

- You must enclose a subquery in parenthesis.
- A subquery must include a SELECT clause and a FROM clause.
- Subqueries that return more than one row can only be used with multiple value operators, such as the IN, ALL, ANY operator.
- A subquery can include WHERE, GROUP BY, and HAVING clauses.
- You can include an ORDER BY clause only when a TOP clause is included.
- You can nest subqueries up to 32 levels.

Advance Operator

- EXISTS
- ALL
- IN
- ANY

EXISTS Operator

- Used to test for the existence of any record in a subquery.
- The EXISTS operator returns TRUE if the subquery returns one or more records.

ALL Operator

- returns a boolean value as a result
- returns TRUE if ALL of the subquery values meet the condition
- is used with SELECT, WHERE and HAVING statements

IN Operator

- The IN operator allows you to specify multiple values in a WHERE clause.
- The IN operator is a shorthand for multiple OR conditions.

ANY Operator

- allow you to perform a comparison between a single column value and a range of other values.
- ANY means that the condition will be true if the operation is true for any of the values in the range.

IN vs ANY

- You must place an =, <>, <, >, <=, or >= operator before ANY

Pratice time

- open file
“LECTURE6_PRATICE_SubQuery
GUIDE-LINE.docx” & read the guide
line

Pratice time (sub query)

- Get the cusomer list that never order
- Get the cusomer list that have at least 2 order
- Get the cusomer list that have at least 2 order in 2022 & at least 1 order in the March
